Architecture Selection: Self-Service Coffee Kiosk System

Architecture Selection:

We chose **Layered Architecture** for the **Self-Service Coffee Kiosk System**.

Architectural Choice and Reasons:

Layered Architecture is suitable for the coffee kiosk because it provides a clear separation of concerns between the user interface, business logic, and data storage. This makes the system easier to understand and maintain.

First, the **Presentation Layer** can handle the touch-screen interactions, while the **Business Layer** can manage orders and payment processing. This separates customer interaction from the core business functionality.

Second, the **Data Layer** can manage menu and pricing information separately from the other components. This makes the system organized and allows data-related functionality to be managed independently.

Security Advantage:

Layered Architecture provides separation between the user interface and the business/data layers. This helps prevent direct access to stored menu and pricing data from the user interface and allows security controls to be applied between layers.

Performance Benefit:

Separating the presentation, business, and data responsibilities helps organize processing efficiently. The system can handle touch-screen interactions through the presentation layer while order and payment processing are handled by the business layer.
